Table 17.2. Normal Oxidation-Reduction Potentials of Some Biologically Important Systems at pH 7.0

| system | $\mathrm{E}_{0}^{\prime}$ | T in ${ }^{\circ} \mathrm{C}$. |
| :--- | :---: | :---: |
| Ketoglutarate $\rightleftharpoons$ succinate $+\mathrm{CO}_{2}+2 \mathrm{H}^{+}+2 \mathrm{e}$ | -0.68 | $-\ddagger$ |
| Ferredoxin | -0.432 | $-\S$ |
| Formate $\rightleftharpoons \mathrm{CO}_{2}+\mathrm{H}_{2}$ | -0.420 | 38 |
| $\mathrm{H}_{2} \rightleftharpoons 2 \mathrm{H}^{+}+2 \mathrm{e}$ | -0.414 | 25 |
| $\mathrm{NADH}+\mathrm{H}^{+} \rightleftharpoons \mathrm{NAD}^{+}+2 \mathrm{H}^{+}+2 \mathrm{e}$ | -0.317 | $30 \dagger$ |
| $\mathrm{NADPH}+\mathrm{H}^{+} \rightleftharpoons \mathrm{NADP}^{+}+2 \mathrm{H}^{+}+2 \mathrm{e}$ | -0.316 | $30 \dagger$ |
| Horseradish oxidase | -0.27 | $-\dagger$ |
| $\mathrm{FADH}_{2} \rightleftharpoons \mathrm{FAD}+2 \mathrm{H}^{+}+2 \mathrm{e}$ | -0.219 | $30 \dagger$ |
| $\mathrm{FMNH}_{2} \rightleftharpoons \mathrm{FMM}+2 \mathrm{H}^{+}+2 \mathrm{e}$ | -0.219 | $30 \dagger$ |
| Lactate $\rightleftharpoons$ pyruvate $+2 \mathrm{H}^{+}+2 \mathrm{e}$ | -0.180 | 35 |
| Malate $\rightleftharpoons$ oxaloacetate $+2 \mathrm{H}^{+}+2 \mathrm{e}$ | -0.102 | 37 |
| Reduced flavin enzyme $\rightleftharpoons$ flavin enzyme $+2 \mathrm{H}^{+}+2 \mathrm{e}$ | -0.063 | 38 |
| Luciferin* $\rightleftharpoons$ oxyluciferin $+2 \mathrm{H}^{+}+2 \mathrm{e}$ | -0.050 | $2 *$ |
| Ferrocytochrome $\mathrm{B} \rightleftharpoons$ ferricytochrome $\mathrm{B}+\mathrm{e}$ | -0.04 | 25 |
| Succinate $\rightleftharpoons$ fumarate $+2 \mathrm{H}^{+}+2 \mathrm{e}$ | -0.015 | 30 |
| Decarboxylase | +0.19 | $-\dagger$ |
| Ferrocytochrome $\mathrm{C} \rightleftharpoons$ ferricytochrome $\mathrm{C}+\mathrm{e}$ | +0.26 | 25 |
| Ferrocytochrome $\mathrm{A} \rightleftharpoons$ ferricytochrome $\mathrm{A}+\mathrm{e}$ | +0.29 | 25 |
| Ferrocytochrome $\mathrm{A}_{3} \rightleftharpoons$ ferricytochrome $\mathrm{A}_{3}+\mathrm{e}$ | $?$ | $-\ddagger$ |
| $\mathrm{H}_{2} \mathrm{O} \rightleftharpoons 1 / 2 \mathrm{O}_{2}+2 \mathrm{H}^{+}+2 \mathrm{e}$ | +0.815 | 25 |

Data from Goddard, 1945. Potentials in all cases are at or near neutrality.
*From McElroy and Strehler, 1954: Bact. Rev. 18.
$\dagger$ From Clark, 1960.
$\ddagger$ From Coddard and Bonner, 1960; In Plant Physiology, a Treatise. Steward, ed. Academic Press, New York. Goddard and Bonner give the NADPH/NADP ${ }^{+}$system as -0.324 , and NADH/NAD ${ }^{+}$ as -0.320 .
§ From Tagawa and Amon, 1962: Nature 195:537-543. The value cited is for spinach ferredoxin.

## Carbon Pools in the Major Reservoirs on Earth

Table 5.1 Carbon pools in the major reservoirs on Earth

| Pools | Quantity $\left(\times 10^{19} \mathrm{~g}\right)$ |
| :--- | :--- |
| Atmosphere | 720 |
| Oceans | 38,400 |
| Total inorganic | 37,400 |
| Surface layer | 670 |
| Deep layer | 36,730 |
| Total organic | 1,000 |
| Lithosphere |  |
| $\quad$ Sedimentary carbonates | $>60,000,000$ |
| Kerogens | $15,000,000$ |
| Terrestrial biosphere (total) | 2,000 |
| Living biomass | $600-1,000$ |
| Dead biomass | 1,200 |
| Aquatic biosphere | $1-2$ |
| Fossil fuels | 4,130 |
| Coal | 3,510 |
| Oil | 230 |
| Gas | 140 |
| Other (peat) | 250 |

## REDOX REACTIONS ARE COUPLED ON

General Reaction

$$
\begin{aligned}
& A(o x)+n(e) \quad A(\text { red }) \\
& -B(r e d)-n(e) \rightarrow B(o x)
\end{aligned}
$$

Photosynthesis
$2 \mathrm{H}_{2} \mathrm{O}+$ light $\longrightarrow 4 \mathrm{H}^{+}+4 \mathrm{e}^{-}+\mathrm{O}_{2}$
$\mathrm{CO}_{2}+4 \mathrm{H}^{+}+4 \mathrm{e}^{-} \rightarrow\left(\mathrm{CH}_{2} \mathrm{O}\right)+\mathrm{H}_{2} \mathrm{O}$

## Oxygenic Photosynthetic Electron Transport

8)

From: Falkowski \& Raven. Aquatic Photosynthesis. (1997)

Figure 1.7 The secondary structure of the small subunit (16S) rRNA from Chiamydomonas reinhardtii. The structure is inferred from homology with known structures in yeast and prokaryotes. Holiow circies and unpaired regions represent areas of generally higher variability between organisms.

The Nernst Equation
$\left[A_{o x}\right]+n\left[e^{-}\right]+m\left[H^{+}\right] \longrightarrow\left[A_{r e d}\right]$
where $\boldsymbol{m}$ is the number of protons involved in the reduction of $A_{o x}$.
The redox potential for this reaction can be calculated by:
$\mathrm{E}=\mathrm{E}_{\mathrm{m} 7}+59 / \mathrm{n} \log \left[\mathrm{A}_{\mathrm{red}}\right] /\left[\mathrm{A}_{\mathrm{ox}}\right]\left[\mathrm{H}^{+}\right]^{m}$
which can be rewritten as:
$E=E_{m 7}+59 / n \log \left(\left[A_{\text {red }}\right] /\left[\mathrm{A}_{\mathrm{ox}}\right]\right)+59(\mathrm{~m} / \mathrm{n}) \mathrm{pH}$
